ijustine: 38-year-old social media star posts the “5G” trope on Instagram after second Moderna injection, diagnosed with blood clots, Paget-Schroetter syndrome

TheCOVIDBlog.com
April 11, 2022

Ms. Justine Ezarik.

LOS ANGELES — A 38-year-old podcaster, Youtuber, and actress faces an uncertain future. But at least she’s reporting it all with smiling emojis and a care-free attitude.

Ms. Justine Ezarik is known to her fans as “ijustine.” She is a social media star with follower counts of over 1.8 million on Facebook, 1.8 million on Twitter, and 1.6 million on Instagram. In fact she said in one interview that she was on of the first 110 people to join Instagram when it launched in 2010. Ms. Ezarik also has 7 million YouTube subscribers and 772,000 TikTok followers.

Her online career commenced in 2006 when she was a [finalist on a Yahoo! talent show](#). That landed her a few television roles before she started [livestreaming her daily life on Justin.tv in 2007](#). Ms. Ezarik, who graduated from the Pittsburgh Technical Institute in 2004, filmed her Justin.tv show at the Mall of America in June 2007, covering the debut of the Apple iPhone. A month later, she published a video called “The 300-page iPhone bill” on YouTube and several other platforms. The short video went viral and made Ms. Ezarik [an internet celebrity](#).

She mostly reviews video games and tech products today, particularly those made by Apple. Ms. Ezarik has also starred in several web series. She won [Streamy Awards](#) (basically the web Oscars) in 2015 and 2016. She’s been nominated for Teen Choice Awards three times since 2010, and also won a Webby Award in 2011.

Ms. Ezarik surpassed one billion total views on YouTube in March 2019. A quick glance at her video comments shows that fans admire her loyalty and longevity in the “Youtuber” space.

One year after the second Moderna shot

Ms. Ezarik is obviously tech smart, except for when it comes to the [injectable Moderna operating system](#) for humans. It’s unclear when Ms. Ezarik received her first injection. But she posted a video on both TikTok and Instagram of her second Moderna injection on April 23, 2021. The TikTok caption reads “5g enabled.” Then she segues to a digitally-enhanced shot of herself with a swollen face, mockingly insinuating that the Moderna shot caused the swelling.

Ms. Ezarik went nearly a full year with no reported adverse effects. Dr. Charles Hoffe posited that most, if not all, vaxx recipients will develop blood clots and suffer eventual heart failure [within two years after the injections](#). Dr. Sherri Tenpenny estimated that vaxx recipients (who receive the real shots) will all die within [“42 days to a year.”](#)

Ms. Ezarik posted a video on TikTok and YouTube on April 6. The YouTube caption says that she’d been in the hospital for five days. But there was no further elaboration. The next day, April 7, she posted a 20-tweet thread explaining what happened.

The first tweet says she was diagnosed with [Paget-Schroetter syndrome](#), which is essentially deep vein thrombosis (DVT) in the upper body instead of the legs. The condition is also known as [venous thoracic outlet syndrome \(TOS\)](#). She also suffered a pulmonary embolism and may require surgery to remove a rib. She ended the tweet with a laughing emoji.

@ijustine

TLDR; I was in the hospital for 5 days with a blood clot in my shoulder that traveled to my lungs (PE). I have a potential diagnosis of paget schroetter syndrome, and may have to have a rib removed 🍷😂

1/20 🧵 Here’s the thread of events that occurred this past week:

The fifth tweet shows her right arm red and swollen on Friday, April 1. She went to the hospital that day and got an ultrasound.

...

5) Fri: I was a little scared falling asleep Thurs night and when I woke up it wasn't much better. My sister and I were supposed to record a podcast. I couldn't lift my arm up to brush my hair and knew this could be very severe if I didn't get help fast.

It found a blood clot in her right shoulder. Doctors administered blood thinners that night. The next day, April 2, doctors inserted a catheter into the clogged vein to attempt dissolving the clot. The [dissolving procedure](#) is called [thrombolysis](#). A potassium IV drip was also inserted in her arm. She slept in the intensive care unit that night.

...

6) We rolled up to the ER telling them I have a blood clot in my arm, they think I'm crazy because "young and healthy" until they saw IT 💪 They quickly got me a bed and ordered an ultra sound.

iJustine  @ijustine · Apr 7

...

12) Procedure happens, they run a catheter into the vein to the clot injecting tPA to dissolve it. I was so loopy coming out of anesetisia and I kept asking everyone if they have any NFTs. I do recall someone saying they have a [@BoredApeYC](#) but I think he was lying..

The next day, Sunday, April 3, the blood clot still hadn't completely dissolved.

iJustine  @ijustine · Apr 7

...

15) Sunday: Procedure round 2, clot still not dissolved 😭 Tried to bribe my Dr to check at 12 hours instead of 24 but he didn't accept my \$100 or 5 **\$ETH** offer.. 24 more hours of bedrest, clot drugs and not moving my arms. I'm pretty defeated tbh 😞

On Monday, April 4, the shoulder clot was clear. But part of it broke off and traveled to her lungs (pulmonary embolism).

iJustine ✓ @ijustine · Apr 7

...

17) Monday: 3rd time is hopefully a charm! They put me out again and I wake up to the good news that it's gone!

Or, so I thought because later that evening I started having chest pains, they ran a CT at 1:30am and found a piece of it broke off and went to my lungs. COOL

She was discharged on Tuesday, April 5. But Ms. Ezarik conceded that she will be on blood thinners for the foreseeable future.

iJustine  @ijustine · Apr 7

...

18) Since I did end up having a PE, they kept me until Tuesday afternoon for monitoring. They were still letting me go home even with the clot in my lung. They said the treatment would be the same and the extensive amount of blood thinners I've been on should clear it up 🩸✅

She reiterated that rib removal still may be required. The procedure is called first rib resection (FRR).

iJustine @ijustine · Apr 7

...

20) A huge thanks to my incredible medical team that made this experience much less scary and saved my life.

Special thanks to [@jennaezarik](#) for taking care of me for 5 days and to everyone who knew what was happening that checked it ❤️

Now, let's hope I can keep my rib..

A 2015 meta-analysis published in the peer-reviewed journal [Annals of Vascular Surgery](#) concluded that permanent symptom relief from Paget-Schroetter syndrome (PSS) after thrombolysis is “more likely to be achieved in patients who undergo FRR with or without [endovenous balloon venoplasty](#) than those whose rib is left intact.”

A 2008 study published in the peer-reviewed journal [Annals of Thoracic Surgery](#) found that 96% of PSS patients improved after FRR. Researchers called FRR “the ideal management” for Paget-Schroetter syndrome.

In other words, if Ms. Ezarik desires some semblance of normalcy back, she’ll likely undergo FRR. She said via Twitter that she has not received a booster shot as of April 8.

Rob @Robcat99_ · Apr 8

Pretty sure you're thinking of the COVID vaccine. I'd love to know if she was recently injected with one of them prior to having this clot incident.

@ijustine

Replying to @Robcat99_ @ThusSpokeJon and @jennaezarik

I was not and did not get the booster.

Multi-faceted education

This blogger had never heard of Webby's, Streamy's, or iJustine prior to writing this article. But more importantly, this story represents the first instances on *The COVID Blog™* of Paget-Schroetter syndrome and first rib resection (FRR) as the best treatment.

Pfizer, of course, knew all along that mRNA injections cause PSS, as it's listed on the company's April 30, 2021 [adverse reaction report](#). Ms. Ezarik quickly confirmed that she received Moderna, not Pfizer, when someone pointed out the foregoing fact. She apparently believes Moderna mRNA is safer and different than Pfizer, which of course is false.

Ms. Ezarik built her entire brand on positive energy and smiling. Granted she's also knowledgeable and well-versed in her craft. But based on the medical literature, the FRR procedure needs to be done sooner rather than later if she wants to attempt putting all this in the rear-view mirror. Ms. Ezarik already must take blood thinners daily, perhaps for the rest of 2022. FRR recovery requires upwards of 12 weeks of physical therapy. No sense in delaying it. All we can do is wish her luck.

Stay vigilant and protect your friends and loved ones.
